ABSTRACT

2 A forensic light source uses a pair of filter wheels to achieve a combination of
3 the characteristics of filters on different wheels and may include a housing which
4 supports the light, filter wheels and other parts with shock absorbing members such as
5 rubber washers or the like to achieve a shock resistant housing. A light source and a
6 plurality of light filters are contained within the housing. The light source is powered
7 by an external power supply, thus making the light source light weight.
